ANTI STATIC CONTROL GUN

WAL 60182

A MUST IN ANY PAINT SHOP

The body is over-injected with a specific none conductive rubber that protects the tool from accidental impacts.

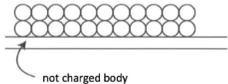

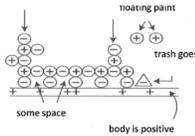

It's atex certified ECM 23 ATEX-B QO25

- Application: to produce ion charged clean air
- Air consumption: less than 200 l/min
- Continuous use time: 6 hours
- Power Supply: Nickel hydrogen battery
- Full charge time 4h
- Recommended working air pressure 2 bar (29 psi)

Have you ever experienced a situation during painting plastic bumpers alongside a metal panel where the plastic appears a different color tone to the metal panel?

Due to the much higher static charge in the plastic it is a fact that paint particles stand up offering a different visual effect to the metal panel where the paint is lying flatter.

The Anti Static Gun is the perfect solution for neutralizing static electricity on all sorts of painted materials. Static electricity can lead to paint contamination, disrupt metallic orientation and cause blemishes in paint, but this battery-operated gun makes it easy to neutralize static charges! It effectively prepares several types of body panels, wood, steel, aluminum and especially plastic surfaces for much cleaner painting.

WITH ANTI STATIC GUN	WITHOUT ANTI STATIC GUN
<p>Without a static charge, the paint particles remain perfectly oriented as they are sprayed. Therefore, efficiency of paint transfer is improved as well as appearance.</p> 	<p>Paints or peals are not located side by side in a uniform order. Paint particles that have been repelled by static charges.</p> 

The static charged particles shown in the right diagram are uneven. This surface will attract dust, uneven metallic lay down and give you a poor finish. When the static is neutralised, the particles are evenly laid down resulting in a dust free finish. **The new WAL 60182 Anti Static Gun will help you achieve the perfect finish.**
